

Statistics Assignments Using Excel®

Assignment #9: One-Way Between Groups ANOVA

A researcher conducts an experiment to compare the effectiveness of different therapies for depression. Participants diagnosed with depression are randomly assigned to one of four groups: Control (no therapy provided), antidepressant medication (SSRI), cognitive-behavioral therapy (CBT), or a combination of medication and cognitive-behavioral therapy (SSRI+CBT). The DV is depression severity after 4 weeks, with higher scores indicating the presence of more depressive symptoms.

<u>SSRI</u>	<u>CBT</u>	<u>SSRI+CBT</u>	<u>Control</u>
11	7	9	12
5	9	6	7
9	6	7	11
7	11	9	9
6	7	5	6
9	6	8	8
11	9	6	11
10	8	4	10
8	7	8	12
9	9	9	9

Is there a statistically significant difference between the groups? With $\alpha = .05$, perform a one-way between groups ANOVA to find out.

1. Perform the ANOVA in Excel by creating your own formulas and with the FDIST function to determine p . Create your own full summary table.
2. Compute the effect size (eta squared).
3. Create either a bar graph comparing the means of the four groups (including standard error bars) or a box-plot display comparing the four groups.
4. Insert a textbox reporting your statistical and research conclusion.
5. Do a final save and submit your work.
